Yield to worst (%) ⁹	-0.07
Yield to Maturity (%) ¹⁰	-0.07
Eff. Duration incl. derivatives and cash	0.26
Average rating	AA+
Average nominal return (%)	1.70

Opportunities

- + High return potential of fixed income derivative strategies in the long run
- + Investments specifically in the global bond markets
- + Interest income on bonds, capital gains opportunities on declining market yields
- + Prospect of additional returns through alternative fixed income macro strategies
- + Derivatives may be used for adjusting the portfolio structure and for hedging purposes
- + Currency gains against investor currency possible

Risks

- High volatility of derivative strategies, losses possible. The volatility of fund unit prices may be strongly increased.
- Underperformance of the bond markets possible
- Interest rates vary, bonds suffer price declines on rising interest rates
- Above-average risk of alternative fixed income macro strategies
- Success of the use of derivatives not guaranteed, losses possible
- Currency losses against investor currency possible

The information given here: (1) is protected by copyright for Morningstar and/or its content providers; (2) may not be reproduced or distributed; and (3) is not guaranteed to be accurate, complete or up-to-date. Morningstar and its content providers assume no responsibility for any losses or damage that result from any use of the information provided. Past performance is not a guarantee of future results. To determine the Morningstar Rating, funds of a comparable group in issue for at least three years are considered. The long-term performance serves as a basis, taking into account fees and risk. As a result, the funds are awarded stars, which are calculated monthly: Top 10%: 5 stars; next 22.5%: 4 stars; middle 35%: 3 stars; next 22.5%: 2 stars; flop 10%: 1 star. A ranking, rating or award is not an indicator of future performance and is subject to change over time.
- 2) Calculated at the net asset value, excl. front-end load, distributions reinvested. Calculation according to method as defined by BVI, the German Fund Companies Association. **Any front-end loads reduce the capital employed and the performance.** All performance data of Allianz Fixed Income Macro Fund - W (Acc) - GBP prior to the launch date, 18/11/2020, refer to another share class of the same investment fund, Allianz Fixed Income Macro Fund, an OEIC organised under the laws of the United Kingdom and managed by ????, namely Allianz Fixed Income Macro Fund - E (Acc) - GBP (ISIN GB00BG43NG36) launched on 18/07/2018. This does not imply that Allianz Fixed Income Macro Fund - W (Acc) - GBP will experience a similar performance in the future. All share classes/investment funds mentioned above are based on the same investment objectives and strategies as well as risk profiles and fee structures. Past performance does not predict future returns
- 3) SFDR: EU Sustainable Finance Disclosure Regulation. Information accurate at time of publishing.
- 4) The all-in fee includes the expenses previously called management, administration and distribution fees. Any payment of a trail fee by the management company to a distribution partner will be effected from the all-in fee.
- 5) The stated ongoing charges reflect the total expense ratio (TER) of the Fund. In the event of a new issue, a short financial year or a fee adjustment, the Fund's ongoing charges will be estimated. Ongoing charges may vary from year to year and do not include transaction costs for the purchase or sale of assets for the Fund. In addition, no costs resulting from any performance-related remuneration are included in ongoing charges.
- 6) The Sharpe ratio states the relationship between the return generated by the fund and the investment risk. The fund's excess return versus the risk-free market rate is compared to volatility. Negative values are not meaningful.
- 7) Volatility measures the fluctuation range of the fund's performance over a specified period of time.
- 8) This is for guidance only and not indicative of future allocation.
- 9) Represents the lowest potential yield that an investor could theoretically receive on the bond up to maturity if bought at the current price (excluding the default case of the issuer). The yield to worst is determined by making worst-case scenario assumptions, calculating the returns that would be received if worst-case scenario provisions, including prepayment, call or sinking fund, are used by the issuer (excluding the default case). It is assumed that the bonds are held until maturity and interest income is reinvested on the same conditions. Calculation is before currency hedging. The yield to worst is a portfolio characteristic; in particular, it does not reflect the actual fund income. The expenses charged to the fund are not taken into account. As a result, the yield to worst is not suitable as an indicator of the future performance of a bond fund. Forecasts are not a reliable indicator of future results.
- 10) The yield to maturity of a bond indicates what capital growth p.a. is theoretically possible up to maturity, if bought at the current price. In addition to coupon income, any price gains/losses up to repayment of the bond are taken into account. The yield to maturity of a fund is the weighted average of the yield to maturity of all the bonds that are held. It is assumed that the bonds are held until maturity and interest income is reinvested on the same conditions. The yield to maturity is a portfolio characteristic; in particular, it does not reflect the actual fund income. The expenses charged to the fund are not taken into account. As a result, the yield to maturity is not suitable as an indicator of the future performance of a bond fund.

Disclaimer

Investing involves risk. The value of an investment and the income from it may fall as well as rise and investors might not get back the full amount invested. Investing in fixed income instruments may expose investors to various risks, including but not limited to creditworthiness, interest rate, liquidity and restricted flexibility risks. Changes to the economic environment and market conditions may affect these risks, resulting in an adverse effect to the value of the investment. During periods of rising nominal interest rates, the values of fixed income instruments (including positions with respect to short-term fixed income instruments) are generally expected to decline. Conversely, during periods of declining interest rates, the values of these instruments are generally expected to rise. Liquidity risk may possibly delay or prevent account withdrawals or redemptions. Allianz Fixed Income Macro Fund is an open-ended investment company with variable capital with limited liability organised under the laws of England and Wales. The value of the units/shares which belong to the Unit/Share Classes of the Sub-Fund that are denominated in the base currency may be subject to an increased volatility. The volatility of other Unit/Share Classes may be different and possibly higher. Past performance does not predict future returns. If the currency in which the past performance is displayed differs from the currency of the country in which the investor resides, then the investor should be aware that due to the exchange rate fluctuations the performance shown may be higher or lower if converted into the investor's local currency.
